

Life Settle Trick on the Moon

Dr. Bhaboota Ram Chouhan

Lecturer Physics, GsssTakhatar (Pali) Rajasthan, India

Email: bhabootarajchouhan@gmail.com

Abstract— How can we settle human on the moon, because, when the moon is nearest for the earth? The Moon is Earth's only a natural satellite and it is the largest natural satellite in the Solar System, in the size of its planet, and it always showing the same face on the earth, so that also always in our eye side. This can easily be settled on human colony like this on the Moon. This means that there are no people beyond the Earth. We do not know where people are, but to set up a human habitation on the moon, life can be generated on a moon by taking water, air, oxygen and carbon dioxide etc. from the earth, but before that even before there should become colony of robots, which is operated by remote control from the earth ground and make them walk, - jump, cleaning on the moon, pit engrave, break stones, causing Working holes, etc. We need to start this experiment for life settle on the moon. The robot should be operated by solar Plate and if possible, a city of solar Plate and Robots should be installed, which is completely controlled by humans, the robot has the car, laptop, camera, microphone etc. and the necessary device, with help they can send signals to the Earth. The bulb also works in the vacuum and with the help of solar light bulb on the Moon it should also be easily made, which is the symbol of our victory or win. Then if the robot is successful in settling in the settlement, then we should use or apply in small creatures as unicellular and after multicolored create organisms should flourish so that the atmosphere of moon surface can be made of human life. It may also be that robots continue to experiment with the materials needed to make gas every day on the moon's surface because it is true that when on the moon reaches the sun's light then there will be gas charge and may also be it. We do not have any information of gas yet there at the moon. It is also that by digging the earth of the moon, the substance of the lower body should be detected by moving it out and leaving a large lens on the Earth's surface, it should also be done using a robot like burning the paper by focusing on the light of sun. It is also true that there is no oxygen, so the paper will not burn but a powerful focused ray mushroom will give new results, for scientists. So, with all this, It is also a way that any change in the body of human or change in biology creature for the living on the moon's land, it is also a system for settle the life on the moon. We find that there is white colour land or surface of the moon, which are Ti and Si, by its can making easily to save life on the moon.

Keywords— Ti-Titanium, Si- Silicon, UV-Ultra Violate, *Solar Heats, O₂-Oxygen, H₂-hydrogen.

I. INTRODUCTION

There are many reasons that, why there is no life on the Moon. Here's why:

(1) First reasons, let's talk about temperature. Temperature is most problems, simple as it is, the Moon can be cold -200 Degree Celsius, and unbearably hot about 200 Degree Celsius. Temperatures can drop as low as -200 to -300 Degrees Celsius. Moreover, since it has no real atmosphere, the temperatures can be as hot 200 to 300 Degree Celsius, as they are cold. So we cannot live on the moon.

(2) Secondly reasons that, there is no magnetic field which are mostly problems. This means that the moon is completely exposed to radiation from the sun, and outer space. So we cannot live on the moon.

(3) Thirdly reasons that, something essential for life as air and water. Although there is some water to be found on the moon but it's not fact, and it is not enough for us to live on the moon.

(4) Fourthly reasons that, oxygen and other gases. The moon lacks water and oxygen. Two essential things for there to be life on the moon it's also a important problem

(5) The fifth reason would be for gravity. The moon's gravity is exactly 1/6 that of Earth, so gravity is low to earth. The gravity, which human bodies are not used to live, or anyone for that matter.

And also there are many more reasons; these are the most basic ones. So we cannot live on the moon. So that mostly problem for life settle on the Moon are in this types -

1. Low Temperature

2. No water
3. No air like O₂, H₂, CO₂, N₂, etc.
4. Low gravity
5. High UV Radiation
6. Cosmic Radiation
7. No magnetic field
8. No food
9. Low pressure
10. Atmosphere not recycled through continental drift
11. No home for live

Humans are constantly trying to save lives on the Moon, but so far, success has not been achieved in this because our ability to work on technical equipment and human has not yet been fully developed, the Moon is the largest of our closest the tree that we can see easily with the naked eyes day or night, on the full moon day it can be seen full circle. My thoughts are thus that when we settled on the planet Mars, there should be a human habitation on the Moon's land before it is settled. It is also that it is very close to the Earth. Its shape is completely like the Earth. In my knowledge, the Moon and Earth The only difference is that the air and gravity on the Earth is high when it is not on the moonlight and even if the climate on the Moon is reduced in the lower dosage then there Under the similarity of the Moon and Earth, both the Moon and the earth are rounded hard, both have large mountains and eaten on both sides of the earth where the earth is ditch, the sea is in the trench. The mountain is also there is born, Of the moon is shaped compared to the Moon, the Moon revolves around the Earth, the satellite may have an eclipse on the Moon and there is also through light There are seven colors in the light and our

organism is of many colors, with the proof that whenever the Sun has come to earth, it will also be true that the Earth can go from the Earth with ease while going on Mars Time will take longer, so life should be saved on the first moon.

II. METHOD

Some important method for LIFE SETTLE TRICK ON THE MOON

(1) In India's mythology, the person has been told to go to Paradise Lok or Hell Folk after death; it proves that except for the earth, it and Ok is there is life on other planet or solar system or in our universe.

(2) We should take the water on the moon, for experimentation from the earth and should be placed in front of the sun and in front of the sun's rays, what will be happening to water, what will happen from the water, if yes, in future, on the moon Can be grown oxygen and hydrogen.

*HEAT

(3) The environment of the Moon is like studying and its similar artificial atmosphere should be created first on Earth, then life can be saved in the first place on Earth, then the life can easily be saved on the Moon.

(4) To make a room on the Moon's land in which there is an environment like the home of the earth, in which the scientist can accept the necessary things like water, air and cloth etc., remain scientist in that room and get out of the sunlight and make new experiments, Life on earth can be saved

(5) When the chemical elements is 118 in periodic table, so chemistry on the earth is something on the moon or something in the water and air

(6) The scientific evidence of how life originated on the earth and the right way should be found on the Moon and then life on the moon can flourish.

(7) First of all, the Robot settlement should be kept on the moon and should be monitored by the camera on them. He should work on them with light work cleaning work, setting up stones, singing, jumping, etc., and work should be started for settling human habitation.

(8) All types of colors are present in the sunlight and in the light of the sun all kinds of substances are also present. Light different things with different elements, such as light on earth, all elements and life have arisen. Therefore, using the sun's light on the moon's land should make a life letter

(9) One should take a piece of the surface of the Moon on the Earth and study its deep analysis and use the carbon dioxide, oxygen, hydrogen and water as well as how to produce it.

(10) By sending several solar plates on the moon and they should be connected to each other by making an artificial sunlight on the surface of the moon for the night, and so that the way to save lives.

(11) The earth should first be used on the surface of the moon by putting it on the surface of the moon and not directly on the human habitation.

(12) Anything that lives on the moon land should be detected on the earth. After we should take step for life settle trick on the moon.

(13) The action of lifting a fenugreek running on a moon plate with a fan running on the Moon should be done so that the particles in there can be stirred. And we will find a new result.

(14) The material that produces the gas should be taken to the moon by using the robot, thereby making the gas hydrogen oxygen nitrogen carbon dioxide etc. so that some of the cases can occur on the moon and a new result may come to the scientists.

(15) Is there a stream of water inside the Earth? It should be detected on the moon that any fluid material will be found at depth of 20 feet.

(16) Lives made by 5 elements as water, sky, space, land, sun light is made of air ground light is made up of sky, so these elements should be used to produce life by making them available on the moon.

(17) When the hydrogen helium gas is present in the sun, every light ray must also contain hydrogen helium gas and it is also available on the moon, this type of life can be saved.

(18) On the surface of the Moon, radioactive substances should be discarded and their transfer should be detected.

(19) The charge on the Moon's surface should be positive-positive, negative-negative, negative-positive consequences; the explosion must be carried out by the charge

(20) From a lens on the Moon's surface, the rays should be installed on a point by putting a ray machine on paper or water and studying the effect

(21) Radio telescope and camera type machine on the Moon's land should be equipped with state-of-the-art equipment.

(22) When Lord Ganesh is remembered while launching any new work in India, scientists should first install a small size of Ganesh god on the surface of the Moon.

III. RESULT AND CONCLUSION

India is a religion patriotic country. Every task here starts with Shri lord Ganesh. It is of course that India should start experimenting on the moon for life settle, the statue of a Ganesh idol from the Rocket on the Moon, which is likely to have amazing results. Any result is achieved when a task is performed, it is useless to expect a result without acting, if it is that using all these points, If we get a cloak then we can settle

a human habitation on the moon's land and if there are any living creatures like the aliens, then technology can be developed on earth by making friends with them, so on the first moon, then on Mars, on Venus, Life on the planet Jupiter, Saturn, etc. can be brought to life on Earth, and life can be secured there and it will be the same in the future.
