School of Marxism, Jiangsu University, Zhenjiang, China

Abstract— The new quality productivity is based on the improvement of workers, labor means, labor objects and their optimal combinations, and is spawned by technological revolutionary breakthroughs, innovative allocation of production factors, and deep industrial transformation and upgrading. The new quality productivity is different from the traditional productivity in development mode, driving ability, productive factors and supporting carrier. Since its inception, the Global Development Initiative has effectively consolidated the international consensus on jointly promoting development, responded to the most urgent needs of the international community, and won wide acclaim from the international community. At the inner logical level, productivity growth is an important driving force for global development, new quality productivity is the transition of productivity under the background of new scientific and technological revolution, accelerating the formation of new quality productive forces is an inevitable requirement for the implementation of the Global Development Initiative. At the level of implementing strategic priorities, relying on new quality productivity, we will strive to realize the Global Development Initiative driven by innovation, we will strive to realize the Global Development Initiative that upholds the harmonious coexistence of man and nature, and we will strive to realize the people-centered Global Development Initiative. At the strategic path level, we will continue to promote the Global Development Initiative through new quality productivity by insisting on innovation, we will implement the initiative to promote global development by opening up to the outside world at a high level and promoting new quality productivity and we will adhere to the all-round development of people to promote the Global Development Initiative.

Keywords— New Quality Productivity, A Community of a Shared Future for Mankind, Global Development Initiative.

I. INTRODUCTION

General Secretary Xi Jinping delivered an important speech at the General Debate of the 76th Session of the UN General Assembly and presented a global development initiative that promotes China's proposals and wisdom to promote the synergy of the international community, solving the problem of the development gap, and implementing the UN's 2030 Agenda for Sustainable Development. Since its inception, the Global Development Initiative has effectively consolidated the international consensus on jointly promoting development, responded to the most urgent needs of the international community, and won wide acclaim from the international community. The Global Development Initiative is closely related to the development of countries around the world, and the development of countries will promote the implementation of the Global Development Initiative. In January 2024, General Secretary Xi Jinping pointed out that high-quality development requires the guidance of new theories of productivity, and a new high-quality productivity emerged and showed strong progress, strength and support for high-quality development in practice. The 11th joint study session of the Political Bureau of the Central Committee of the RKP. The formation and development of new quality productive forces has an extremely important historical position, is an inherent requirement and an important focus for promoting high-quality development, and injected fresh energy into the implementation of the Global Development Initiative.

II. THE INTERNAL LOGIC OF NEW QUALITY PRODUCTIVITY TO PROMOTE THE IMPLEMENTATION OF THE GLOBAL DEVELOPMENT INITIATIVE

Productivity growth is an important driving force for global development. At present, global economic growth is sluggish, and there are many ways to revitalize global development, but productivity is the most basic driving force. Productivity is a complex system composed of many elements, the basic elements of which are laborers, labor means and labor objects, representing the relationship between people and nature in the process of material production. Every technological revolution in human history has resulted in a huge liberation of productive forces. The first industrial revolution ushered in the era of replacing manual labor with machines, the second industrial revolution enabled the world to move from the "steam age" to the "electrical age," and the third industrial revolution ushered in the information age. The three industrial revolutions, while leading the revolution in productivity, also pushed the world forward.

New quality productivity is the transition of productivity under the background of new scientific and technological revolution. Human society has fully enjoyed the enormous fruits of productivity innovation brought by the three industrial revolutions, and now a new round of scientific and technological revolution and industrial transformation is booming, and we have entered the era of digital intelligence. In this era, digital intelligent scientific and technological innovation has been placed in a more important position, there is no doubt that the new quality of productivity is the future social development needs of productivity. The so-called new

quality productivity means that innovation plays a leading role, gets rid of the traditional economic growth mode and productivity development path, and has the characteristics of high-tech, high efficiency and high quality, and is in line with the new development concept. It takes the leap of workers, labor materials, labor objects and their optimal combinations as its basic connotation, and represents the leap of productive forces under the background of the new scientific and technological revolution.

Accelerating the formation of new quality productive forces is an inevitable requirement for the implementation of the Global Development Initiative. For a new high-quality productivity, characterized by a significant increase in total productivity and characterized by innovation, quality is the key and higher productivity is the core. New quality productive forces, with new factors of production, new modes of production, and new drivers of development, help solve the problem of development deficit and promote the implementation of the Global Development Initiative.

III. THE STRATEGIC FOCUS OF NEW QUALITY PRODUCTIVITY TO PROMOTE THE IMPLEMENTATION OF THE GLOBAL DEVELOPMENT INITIATIVE

Relying on new quality productivity, we will strive to realize the Global Development Initiative driven by innovation. Entering the era of digital intelligence, the performance of the industrial system dominated by traditional manufacturing is gradually inferior to that of the knowledge economy system dominated by high-tech industries and the new economic system dominated by emerging industries. Scientific and technological innovation can give birth to new industries, new models and new drivers, which constitutes the core factor of developing new quality productivity, and is fully in line with the propositions of the Global Development Initiative. The Global Development Initiative is innovation-driven. In the context of the new scientific and technological revolution, we should accelerate the transformation of scientific and technological achievements into real productive forces, tap new drivers of post-pandemic economic growth, and work together to achieve leapfrog development. Accelerating the transformation of scientific and technological achievements into real productive forces is inseparable from the development of new quality productive forces.

Relying on the new quality of productivity, we will strive to realize the Global Development Initiative that upholds the harmonious coexistence of man and nature. General Secretary Xi Jinping proposed that "green water and green mountains are gold and silver mountains", promoting green development, promoting harmonious coexistence between man and nature, and once again emphasizing the construction of a community of life between man and nature, accelerating green low-carbon transformation, and achieving green recovery and development when putting forward the Global Development Initiative in the general debate of the seventy-sixth United Nations General Assembly. China will strive to achieve carbon peak by 2030 and carbon neutrality by 2060, and in order to achieve this goal, it needs to rely on new quality productivity. The new quality productivity itself is a green productivity, adhering to the

concept of adhering to ecological priority and accelerating green technology innovation, paying attention to the leading role of green finance, building efficient ecological green industrial clusters, and the realization of carbon peak carbon neutral goal have coupling interaction, so to a certain extent, it can promote the realization of the Global Development Initiative of harmonious coexistence between man and nature.

Relying on the new quality of productive forces, we will strive to realize the people-centered Global Development Initiative. Marx pointed out that workers create great wealth for capitalists through hard work, but in the heavy work can not get substantial improvement in life, this situation leads to the lack of happiness in the work of workers, but constantly deny their own existence, and themselves in opposition to the products they created. In the age of digital intelligence, talent is the most important resource for development. The development of new quality productivity, by virtue of its more efficient use of existing resources, promotes a more equitable distribution of resources and wealth, thus improving the working mechanism of talent training and creating an environment where everyone can benefit from promoting the implementation of the Global Development Initiative, so as to promote the all-round development of people.

IV. THE STRATEGIC PATH OF NEW QUALITY PRODUCTIVITY TO PROMOTE THE IMPLEMENTATION OF THE GLOBAL DEVELOPMENT INITIATIVE

We will continue to promote the Global Development Initiative through new quality productivity by insisting on innovation. Economic benefits and environmental protection are never opposites, and the two important trends in the new round of scientific and technological revolution are greening and digitalization, which are also the important direction of new quality productivity to promote the implementation of the Global Development Initiative. Therefore, it is necessary to practice the concept of green development in the process of promoting the implementation of the Global Development Initiative by new quality productivity, which is manifested in adhering to the innovation-driven development strategy. In recent years, the world has made some achievements in scientific and technological innovation, but it also faces a series of problems such as high energy consumption and high emissions. In order to deal with these problems, it is necessary to accelerate the promotion and application of advanced green technologies to achieve the reduction of carbon emissions and energy consumption. At the same time, strengthen the development of green center data, improve energy efficiency, and effectively respond to the growing digital demand.

We will implement the initiative to promote global development by opening up to the outside world at a high level and promoting new quality productivity. Since the reform and opening up, China has actively participated in the international division of labor, and made full use of its comparative advantages to obtain the huge development of productive forces. However, gradually affected by the global economic downturn, the weakening of its own comparative advantage, the lack of power of traditional industries and other factors, China needs to expand a high-level opening to the outside world,

create a good international environment for the development of new quality productivity, and create new international competitive advantages. Through a high level of opening up, international scientific and technological exchanges and cooperation can be strengthened, the open domestic and foreign innovation models of mutual benefit and mutual promotion can be formed, and a solid scientific and technological foundation can be laid for the development of new quality productive forces in China, so that the world can hear the voice of the Global Development Initiative put forward by China.

Adhere to the all-round development of people, the new quality of productive forces and promote the Global Development Initiative. The Global Development Initiative is people-centred, securing and improving people's livelihoods and protecting and promoting human rights during development. Similarly, the development of new quality productivity puts forward higher requirements for the ability of workers, and needs to pay attention to the training of talents. First of all, by reforming the education system, focus on the cultivation of problem-solving ability and innovative thinking, and continue to export talents to meet the needs of the future society. Secondly, strengthen vocational education and skills training to provide more professional and technical personnel for the development of different fields. Finally, it is also necessary to promote the flow of talents, support the exchange and cooperation of talents in different fields and regions, and promote the sharing and optimization of talent resources. In addition to the cultivation of talents and abilities, it is also necessary to pay attention to the corresponding welfare matching and the improvement of rights protection channels, so as to promote the all-round development of people and promote the implementation of the Global Development Initiative.
